

Спорт на экране телефона

SPORT = {ВСТАВЬ_СЮДА_ВИД_СПОРТА}

SUBJECT: Hyperreal macro photo of a premium modern smartphone in iPhone Pro style (silver stainless flat frame). The phone lies diagonally on artificial sports turf; a white field marking line runs under the phone. Around it: scattered dark rubber granules and tiny glass debris. The display glass is heavily shattered with large jagged perimeter cracks, lifted sharp fragments, missing chunks, visible micro-scratches and dust. Inside the broken screen, instead of a normal display, there is a miniature stadium diorama sunk into the phone: adapt the stadium/pitch/court/rink markings, equipment (ball/puck/hoop/net/goals), and player roles/poses to match SPORT; keep two contrasting team kits (default colors: red vs blue), a referee (default: turquoise), and a goalkeeper only if SPORT uses one (default: yellow). Stadium stands with crowd texture, LED boards along the edges, soft floodlight glow.

STYLE / MEDIUM: Photorealistic practical-diorama illusion, ultra realistic materials (tempered cracked glass, brushed stainless steel, rubber granules, turf fibers). No illustration look, no toy-like CGI.

LIGHTING: Soft natural window daylight from upper-left (~45°), neutral daylight color, realistic reflections on metal and glass, natural shadows, no harsh glare.

LENS / COMPOSITION: 3/4 low angle close-up, macro feel, shallow depth of field, sharp focus on the phone and the miniature stadium interior, smooth background bokeh, 16:9 framing.

QUALITY: 4K, ultra-detailed, crisp textures, cinematic contrast, natural color grading.

NEGATIVE: text, watermark, logo, extra cameras, extra buttons, wrong phone proportions, cartoon, illustration, toy-like CGI, blur, low detail, artifacts, duplicated players, extra balls/pucks, incorrect markings, normal phone UI on the screen, overexposed highlights.

Город в чашке кофе.

CITY = 'Prague'

{CITY} - ultra-detailed isometric miniature 3D cartoon diorama, clear 45° top-down view, orthographic/isometric feel (no strong perspective), centered composition.

Scene: close-up porcelain coffee cup on a warm wooden table, filled with cappuccino foam; inside the foam a floating, highly detailed miniature cityscape of {CITY} occupying most of the frame. Feature the most iconic, instantly recognizable landmarks of {CITY} in the center, surrounded by dense modern buildings with soft neon signage; add tiny realistic streets and micro-vehicles moving smoothly.

Lighting: cinematic, soft glow, practical neon accents, subtle volumetric haze; shallow depth of field with creamy bokeh; crisp micro-details on landmarks, gentle falloff to blur at the edges; dreamy magical atmosphere.

Rendering: extremely detailed, highly photoreal materials (porcelain, wood grain, foam micro-bubbles, glass/metal), 8K cinematic finish.

Aspect ratio: 16:9

Обязательно загрузите свое фото для референса.

Для маркетинга рука наливает стакан.

Use the uploaded image strictly for pose, framing, lighting, and perspective matching.

Only change the drink branding, label text, and liquid color to match my custom product.

Using the uploaded image as the exact scene, camera, and composition reference, recreate the same visual illusion where a hand is pouring my own branded drink from a glass bottle into a glass held by a person inside a smartphone screen.

Replace the original bottle with my uploaded drink while keeping:

The same pouring angle

The same realistic liquid flow

The same smartphone position, desk, window light, and background setup

The person inside the phone should remain smiling naturally and holding the glass inside the screen, with realistic depth and screen edge reflections so it looks like the drink is actually crossing from the real world into the digital screen.

The liquid should match my drink's color and transparency, with:

Realistic splash physics

Natural highlights

Tiny bubbles and refraction inside the stream

Lighting must stay soft natural daylight from the window, with warm indoor tones and subtle shadows on the wooden desk.

Style: ultra-photorealistic advertising composite, hyper-real realism, shallow depth of field, commercial product photography quality, 8K detail.

3D модель фигурки.

Use the uploaded character photo as the identity reference (face, hairstyle, suit silhouette).

Create an ultra hyper-realistic premium advertising product photo in a vertical 9:16 portrait aspect ratio.

Scene: a modern luxury walnut computer desk in a real home studio. Center foreground: a 1/7 scale commercial collectible figurine of the same character, standing naturally on a perfectly clear, round transparent acrylic base (absolutely no text, no logo, no engraving). The acrylic base has realistic refraction, crisp edge highlights, subtle micro-scratches, and soft internal reflections.

Figurine realism: premium painted resin with ultra-detailed materials and micro-textures. Suit fabric weave and stitching are visible, realistic folds and tension points, natural skin subsurface scattering, sharp eyes with glossy wetline, believable pores (not overdone), hair with fine strands. Different material roughness: matte suit, slightly satin shirt, polished leather shoes. Perfect manufacturing quality, but still physically believable (no CGI look).

Environment details (expensive ad feel): clean but lived-in desk elements—mechanical keyboard with gentle sheen, mouse on a textured desk mat, a minimal metal pen, a small stack of design books, and a ceramic espresso cup. Add subtle realism: faint fingerprints on glossy surfaces, tiny dust particles in the air catching light, clean realistic shadows and contact occlusion under the shoes and base.

Lighting: high-end commercial product lighting. Warm soft key light from a diffused desk lamp, cool fill from the monitor, subtle rim/back light to separate the figurine from the background. Cinematic HDR, controlled specular highlights, soft gradients, shallow depth of field with creamy bokeh (editorial product-shot look), natural white balance, accurate reflections.

Computer screen: show a 3D modeling workflow of this same figurine—multiple viewports (wireframe, clay render, textured preview), sculpting tool panels, layer list, and a turntable preview. The UI looks authentic and sharp, and the model on-screen matches the real figurine on the desk.

Packaging: next to the monitor place a high-end collectible figure box with premium print finishing—matte laminated cardboard, spot UV and subtle emboss on the name area, and a small holographic “LIMITED EDITION” sticker. The box is printed with original artwork and includes two flat 2D illustration views of the character (front + side). No real brand logos.

Camera: 85mm product lens look, macro-level sharpness on the figurine, slight film grain, clean color separation (warm highlights / cool shadows), ultra photo realistic, 8K detail, realistic imperfections, no cartoon, no toy-plastic vibe, no CGI render look.
