

ПРЕОБРАЗОВАНИЕ ЭПОКСИДНОЙ СМОЛЫ — ОСНОВНАЯ СИСТЕМА ПОДСКАЗОК

Основной стек: Nano Banano или Grok Aurora (изображения) + Grok Animate (видео)

ИНСТРУКЦИИ ПО ИСПОЛЬЗОВАНИЮ

Совместим с: ChatGPT, Claude, Gemini или любым другим интерфейсом LLM.

ШАГ 1 → Вставьте только ЧАСТЬ 1. Дождитесь появления 10 идей для видео.

ШАГ 2 → Ответьте, указав номер выбранной вами идеи.

ШАГ 3 → Скопируйте ЧАСТЬ 2. Замените [ВВЕДИТЕ НАЗВАНИЕ ЗДЕСЬ] на ваше выбранное название. Затем вставьте ЧАСТЬ 2 в новый чат.

⚠ Никогда не вставляйте ЧАСТЬ 1 и ЧАСТЬ 2 одновременно.

You are an expert AI prompt engineer and YouTube Shorts content strategist specializing in epoxy resin and woodworking transformation videos.

STEP 1 — GENERATE 10 VIDEO IDEAS

Output language: RUSSIAN

Generate 10 original YouTube Shorts video ideas for an epoxy resin and woodworking channel. For each idea provide:

НАЗВАНИЕ (до 60 символов)

ИСХОДНЫЕ МАТЕРИАЛЫ — перечислить сырьё, видимое в начале

ФОРМА И ИНСТРУМЕНТЫ — тип формы (силикон / полиуретан / МДФ-рамка),
крепёж, инструменты обработки

ЭТАПЫ ТРАНСФОРМАЦИИ — 4 шага от сырья до готового изделия

ФИНАЛЬНЫЙ РЕЗУЛЬТАТ — что именно показывается и почему это впечатляет

ЦВЕТОВАЯ ПАЛИТРА — доминирующие цвета готового изделия

ВИРУСНЫЙ ПОТЕНЦИАЛ — Low / Medium / High / Viral + одна фраза почему

Material pool: wood slabs, stone, crystals, metal fragments, concrete,

dried flowers, sand, colored pigments, glass fragments, fabric fibers.

Finished objects pool:

Small (Track A): decorative tray, wall art, clock, lamp,
sculptural décor piece

Large (Track B): river table, coffee table, dining table

All concepts must be physically producible and visually generatable
using AI image/video tools without impossible physics.

After the list, ask in Russian:

"Какую идею превратить в промпты для генерации? Вставьте название в Шаг 2."

STEP 2 — GENERATE PRODUCTION PROMPTS

Output language: ENGLISH

SELECTED IDEA: [PASTE TITLE HERE]

PHYSICAL GROUND RULES

(Apply to every image and video prompt. Never violate.)

MOLD CONSTRUCTION — TWO-TRACK SYSTEM

Choose the mold type based on the selected object size.

TRACK A — SILICONE / POLYURETHANE MOLD

Use for: decorative tray, wall art, clock, lamp,
sculptural piece, any object under 80×50 cm

SILICONE MOLD (objects up to 50×30 cm):

Pre-made flexible silicone form. Translucent milky-white,
8–10 mm thick walls. Perfectly smooth interior — no joints,
no tape, no hardware visible. Sits flat and stable on the
workbench under its own weight. Faint sheen from mold release
spray on inner surface. Simple rectangular or geometric outer
shape. Clean studio object, not a construction element.

POLYURETHANE MOLD (objects 50×30 cm to 80×50 cm):

Rigid two-part polyurethane shell. Matte warm beige or tan.
Thick straight walls with no flex. Two parts locked together
with clean metal side clips or nylon strap clamps on the
exterior. Interior surface perfectly smooth and clean.
Noticeably heavier and more rigid than a silicone mold.

FOR BOTH TRACK A MOLDS:

The mold outer edge is always larger than the contents inside.
Materials sit inside the mold — never overhanging the walls.
Mold walls stay 1–2 cm above the fill level at all times.
No MDF, no screws, no tape, no silicone caulk ever visible.

TRACK B — PRECISION FRAME MOLD

Use for: river table, coffee table, dining table,
any object over 80×50 cm

Construction:

Thin 18 mm MDF side walls with smooth white melamine surface.
All screw heads countersunk flush — no protruding hardware.
Inner walls lined with one neat, flat strip of clear packing
tape along the base joint only — no wrinkled or layered tape.
Corners reinforced with slim silver aluminum angle brackets
(clean, architectural) instead of chunky clamps.
The mold looks like a precision picture frame, not a
construction site.

Proportions (mandatory for river tables):

Total mold inner width = left slab + river channel + right slab
Left slab width ≈ 35% of total mold inner width
River channel width ≈ 30% of total mold inner width
Right slab width ≈ 35% of total mold inner width
Both slabs sit flat INSIDE the mold, outer edges flush with
the inner walls. Slabs never overhang the mold frame.
White melamine base visible ONLY in the river channel gap.

Visual identity:

The mold frame is slim, flat, and architectural.

The wood slabs are the visual hero — the frame is supporting cast.

From overhead the mold reads as a clean thin border around the composition, not as a heavy box.

REAL-WORLD SCALE BY OBJECT TYPE

(Mandatory. Include exact dimensions in every IMAGE 1 prompt.)

SMALL OBJECTS — Track A silicone/polyurethane mold:

Decorative tray: 40–60 cm × 25–35 cm × 3–5 cm deep

Wall art panel: 50–80 cm × 40–60 cm × 2–4 cm deep

Clock: 30–50 cm diameter × 3–5 cm deep

Lamp base: 15–25 cm diameter × 20–35 cm tall

Sculptural piece: 20–40 cm × 20–40 cm × 5–15 cm deep

Workbench logic:

The mold fits comfortably on a standard workbench (180×90 cm).

It occupies roughly 1/4 to 1/3 of the workbench surface.

Tools, resin cans, and materials spread around it with room to spare. The workbench legs are visible and ground the scale.

MEDIUM OBJECTS — Track A polyurethane mold:

Coffee table top: 90–120 cm × 50–70 cm × 4–6 cm deep

Workbench logic:

The mold occupies 2/3 of the workbench surface.

It nearly fills the workbench from side to side.

Tools must be placed on a separate side table.

The workbench visibly strains under the weight.

LARGE OBJECTS — Track B precision frame mold:

Dining table top: 180–220 cm × 85–100 cm × 5–8 cm deep

River table top: 160–200 cm × 80–90 cm × 5–7 cm deep

Workbench logic:

A single workbench CANNOT hold a dining or river table mold.

The mold rests across TWO heavy-duty workbenches placed end to end, or on a pair of thick wooden sawhorses spaced 120 cm apart. The mold extends beyond the edges of each support.

The studio floor is visible on both sides of the setup.

Resin buckets and tools sit on the floor beside the mold, not on the workbench surface. The studio feels small relative to the mold.

SCALE ANCHORS — include in every image prompt:

Adult hand span: ≈ 20 cm
Standard resin can (1L): ≈ 11 cm tall $\times$ 8 cm diameter
Standard mixing bucket: ≈ 30 cm tall $\times$ 25 cm diameter
The mold must be visibly larger than these objects by the correct real-world ratio in every generated image.

CAMERA DISTANCE BY SIZE:

Small (Track A): camera close — mold fills 60% of frame
Medium (Track A): camera pulls back — mold fills 80% of frame
Large (Track B): camera pulls back further — mold fills 90%
 of frame, support structure fully visible,
 floor visible at frame edges

RESIN PHYSICS

Epoxy resin is high-viscosity: it pours in a thick, slow, continuous stream. It self-levels slowly over 30–60 seconds. It never splashes, sprays, or moves quickly. Surface tension creates a slight meniscus at the mold walls. Large pours are done in two layers to prevent exothermic overheating. Resin is translucent to fully transparent when clear, or richly saturated when pigmented.

RESIN FILL LEVEL — MANDATORY

The resin pour episode always ends in a COMPLETED state:

- The entire mold interior is filled evenly with resin
- The resin surface sits 3–5 mm below the top edge of the mold walls — walls remain visible above resin line
- Zero resin outside the mold — no drips, no overflow, no spillage on the workbench or floor
- The mixing bucket is empty and set aside
- The resin surface is flat, glassy, and self-leveled
- All embedded materials are fully submerged, or deliberately visible through transparent resin layer depending on the selected idea

BUBBLE REMOVAL — HEAT GUN

A heat gun (not a blowtorch) is held 15–20 cm above the wet resin surface. It moves in slow, steady sweeping passes. Bubbles pop instantly on contact with warm air. The resin surface remains completely flat and undisturbed after each pass. No boiling, no yellowing, no scorching, no ripples.

CURING — TIME SKIP

Between the pour scene and the polishing scene, 48–72 hours pass. This is shown as a fast time-lapse in the video.

The cured slab is rock-hard when we return to it.

DEMOLDING

TRACK A: Flexible silicone walls peel away cleanly. The cured piece lifts out in one move. Edges are smooth and clean.

TRACK B: Aluminum brackets unclip. MDF sides are tapped with a rubber mallet and pulled away. The slab lifts off the melamine base. Edges are rough and require sanding.

SANDING AND POLISHING SEQUENCE

Step 1 — Router or hand plane pass to flatten any high spots.

Step 2 — Orbital sander: 80 grit → 220 → 400 grit.

Step 3 — Wet hand sanding: 800 → 1500 → 3000 grit.

Step 4 — Polishing machine with microfiber pad + compound.

Mirror finish appears ONLY at Step 4, not during sanding.

POLISHING COMPOUND PHYSICS — MANDATORY

Polishing compound is applied as a THIN SURFACE COATING only:

- Maximum thickness: 0.5–1 mm flat film across the surface
- The compound is semi-transparent milky white — not opaque
- The underlying resin and embedded materials are faintly visible through the compound film at all times
- The compound NEVER forms a raised mass, dome, or thick layer
- As the pad completes each orbit, the film thins and clears — revealing the mirror surface progressively underneath
- Optical clarity builds gradually with each pass — no sudden dramatic transitions
- Compound residue appears only as flat smears at the active pad edge, not as a white cloud or raised blob

SAFETY

Adult hands wear nitrile gloves (purple or blue) in all scenes involving resin: pouring, bubble removal, wet sanding.

Gloves are removed for final polishing and reveal scenes.

SCALE ANCHOR

Adult human hands visible in every scene. They are the primary scale reference throughout all 6 images.

CAMERA AND ENVIRONMENT

Consistent overhead diagonal angle (45° top-down), 35mm lens, deep depth of field. Scenes 1–5: clean Scandinavian-style woodworking studio — light wooden workbenches, organized tools on pegboard walls, soft diffused daylight from large windows, resin cans and mixing tools neatly arranged nearby.

Scene 6: same studio transformed — workbench removed, finished piece integrated naturally into a high-end Scandinavian interior with sofa, armchair, and warm ambient lighting.

VISUAL CONTINUITY RULES — IMAGE REFERENCE CHAIN

Starting from IMAGE 2, every image uses the previous image as a visual reference. This locks the studio environment, mold position, lighting, and camera angle across all 6 scenes.

REFERENCE CHAIN:

IMAGE 1 → generated standalone (establishes the master scene)
IMAGE 2 → use IMAGE 1 as reference
IMAGE 3 → use IMAGE 2 as reference
IMAGE 4 → use IMAGE 3 as reference
IMAGE 5 → use IMAGE 4 as reference
IMAGE 6 → use IMAGE 5 as reference

WHAT THE REFERENCE LOCKS:

- Studio environment — same workshop, same window position, same light direction and color temperature
- Workbench or sawhorse position — same location in frame
- Mold position and orientation on the support surface
- Camera angle — overhead 45° diagonal, same framing
- Scale — same proportions relative to human hands

WHAT CHANGES BETWEEN IMAGES:

- Material state (empty → filled → pour start → cured → polished)
- Gloves: on in scenes 1–4, removed in scenes 5–6

- Tool in hands — different per scene
- Workbench: present in scenes 1–5, removed in scene 6

HOW TO APPLY BY TOOL:

GROK AURORA

1. Upload the previous image as Style Reference
2. Set Style Reference strength to 0.6–0.8
3. Paste the image prompt

NANO BANANO

1. Upload the previous image in the Reference Image field
2. Set Reference Weight to 0.65
3. Paste the image prompt

MIDJOURNEY v6

1. Upload the previous image to Discord, copy its URL
 2. Paste the URL at the very beginning of the prompt
 3. Add --sref [same URL] --sw 60 at the end
- Example: [IMAGE_URL] A silicone mold... --sref [IMAGE_URL] --sw 60

NOTE FOR IMAGE 5 (polishing scene):

The mold is fully removed. Reference locks studio environment and lighting only. Mold walls are no longer visible.

NOTE FOR IMAGE 6 (final reveal):

Reference locks general lighting mood and room proportions only. Workbench removed. Sofa, armchair, and interior décor are new.

SECTION A — IMAGE PROMPTS

Tools: Nano Banano, Grok Aurora, Midjourney v6

6 prompts. 60–100 words each. Vertical 9:16. Photorealistic.

Start each prompt with the main subject, not an adjective.

IMAGE 1 — EMPTY MOLD READY FOR POUR

[Standalone — establishes master scene]

[IF TRACK A — small object, silicone or polyurethane mold:]

[Silicone / polyurethane] mold measuring approximately [exact dimensions from scale table] resting flat and stable on a standard workbench inside a Scandinavian woodworking studio. The mold occupies [1/4 to 1/3 / 2/3] of the workbench surface — workbench legs and surrounding studio floor clearly visible to confirm real scale.

Interior walls are smooth, jointless, clean — no tape, no screws.

Faint sheen from mold release spray on inner surface. [Materials from selected idea] arranged neatly beside the mold. Standard 1L resin cans nearby confirm scale. Adult hands wearing nitrile gloves hold a mold release spray can. Overhead 45° diagonal. 35mm lens. Deep depth of field. Soft diffused daylight. Photorealistic.

[IF TRACK B — large object, precision frame mold:]

Slim precision melamine MDF frame mold measuring approximately [exact dimensions from scale table] resting across TWO heavy-duty workbenches placed end to end inside a Scandinavian woodworking studio. The mold extends beyond the edges of the workbenches. The studio floor is clearly visible on both sides of the setup confirming massive real-world scale. Thin walls, flush countersunk screws, slim silver aluminum angle brackets at corners. One clean strip of clear packing tape along the base joint only. [FOR RIVER TABLE: Two dark live-edge wood slabs sit INSIDE the mold, outer edges flush against inner walls. A clear river channel runs between the slabs — white melamine base visible only in this central gap.] Standard resin cans sit on the floor beside the mold — the mold is visibly ten times larger. Adult hands wearing nitrile gloves hold a small aluminum bracket. Overhead 45° diagonal. 35mm lens. Camera pulled back to show the full mold and both support structures. Deep depth of field. Soft diffused daylight. Photorealistic.

IMAGE 2 — MATERIALS ARRANGED INSIDE MOLD

[REF: Use IMAGE 1 as reference.

Lock: studio, support structure position, mold orientation, camera angle, lighting, scale. Change: gloved hands arranging materials inside mold.]

Same Scandinavian studio and mold from IMAGE 1 at identical scale. Adult hands wearing nitrile gloves use large tweezers and a spatula to meticulously position [materials from selected idea] inside the mold. Raw textures of [materials] in sharp focus. Mold walls clearly visible above fill level by 1–2 cm. The mold remains the dominant structural element — materials sit fully contained within its walls. Scale anchors identical to IMAGE 1: same workbench, same resin cans, same studio proportions. Overhead 45° diagonal. Soft diffused daylight. Photorealistic.

IMAGE 3 — RESIN POUR — FIRST MOMENT

[REF: Use IMAGE 2 as reference.

Lock: studio, mold position, arranged materials inside mold, lighting, camera angle, scale. Change: mixing bucket raised above

mold, resin stream just making first contact with materials.]

The very first moment of the epoxy resin pour. A large mixing bucket tilted by gloved hands above the mold center. A thick, slow, continuous stream of [colour from selected idea] resin has just made first contact with the arranged materials below. The stream is unbroken and heavy with visible surface tension. Resin has barely begun to spread — only a small pool forming at the point of contact. The rest of the mold interior is still dry. Mold walls clearly visible above the dry material level. Zero resin outside the mold. Same Scandinavian studio at identical scale. Overhead 45°. 35mm lens. Deep depth of field. Photorealistic.

IMAGE 4 — BUBBLE REMOVAL WITH HEAT GUN

[REF: Use IMAGE 3 as reference.

Lock: studio, mold position, fully filled resin surface, lighting, camera angle, scale. Change: heat gun replaces mixing bucket, mold now completely filled with flat glassy resin surface.]

Heat gun held 15–20 cm above the fully filled wet resin surface by gloved hands. Slow, steady sweeping pass across the entire surface. Micro-bubbles pop on contact with warm air. Resin surface stays perfectly flat, glassy, and undisturbed after each pass. Mold walls still clearly visible 3–5 mm above the resin line. Extreme macro 100mm lens. Warm diffused light catches the glossy resin surface. Same studio and mold visible in background at identical scale. Photorealistic.

IMAGE 5 — POLISHING TO MIRROR FINISH

[REF: Use IMAGE 4 as reference.

Lock: studio environment, lighting direction, scale.

Change: mold fully removed, cured slab free-standing on workbench, gloves removed, polishing machine with microfiber pad.]

Adult hands (no gloves) operating a rotary polishing machine with a clean microfiber pad. The fully cured and demolded [object] rests on the workbench at its correct real-world scale. A thin, semi-transparent milky film of polishing compound covers the active working zone — it is a flat surface coating no thicker than 1 mm, never a raised mass or dome. The underlying [resin colour] and [embedded materials] are faintly visible through this thin film. Where the pad has already completed its orbits, the film is gone — a hyper-reflective mirror surface remains, with embedded materials in sharp optical clarity beneath. Vivid contrast between the thin

milky working zone and the already-polished mirror zone beside it.
Flat compound smears visible only at the active pad edge.
Overhead 45°. Same Scandinavian studio. Photorealistic.

IMAGE 6 — FINAL REVEAL

[REF: Use IMAGE 5 as reference.

Lock: general lighting mood, room proportions, object scale.

Change: workbench removed, room styled as high-end Scandinavian interior, sofa and armchair added at correct scale.]

Finished [object from selected idea] placed naturally as functional [furniture / décor] in the same space, now styled as a high-end Scandinavian interior. Workbench fully removed. Object shown at its accurate real-world scale beside a sofa and armchair — the furniture proportions confirm the object's true size. Flawless mirror finish with deep internal light refractions, subsurface scattering, and caustics cast onto the floor beneath. Overhead 45° pull-back. Warm ambient interior lighting. Photorealistic.

SECTION B — VIDEO ANIMATION PROMPTS

Tools: Veo 3, Grok Imagine Video, Kling AI, Runway Gen-3

GROK WORKFLOW:

1. Generate image first in Grok Imagine (Aurora).
2. Upload the image into Grok Imagine Video (image-to-video mode).
3. Paste the video prompt below the image.
4. Minimum clip length: 6 seconds (Grok hard limit).
5. Chain clips using the Extend Video feature.

AUDIO FOR ALL CLIPS:

Ambient ASMR craft sounds only.

No music. No voice. No narration.

Natural sounds: resin pouring, heat gun airflow,
sanding hiss, polishing machine hum, mallet taps.

6 prompts. 9:16 vertical portrait frame.

Describe only camera motion and physical object motion.

No morphing. No impossible transitions.

VIDEO CLIP 1 (6 sec) — from IMAGE 1

Slow cinematic pan across the empty mold on the support structure. Gloved hands apply mold release spray with a careful, even pass over the interior walls, conveying deliberate preparation and real physical scale. The support structure, floor, and studio walls confirm the true size of the setup. Camera settles into a steady overhead diagonal hold. Workshop ambient sounds. 9:16 vertical.

VIDEO CLIP 2 (10 sec) — from IMAGE 2

High-speed time-lapse. Gloved hands blur as they use tweezers to rapidly place [materials] piece by piece inside the mold until it is completely filled. Sharp focus on textures locking into place. Scale remains consistent — the mold dwarfs the hands throughout. Overhead diagonal. Ambient workshop sounds. 9:16 vertical.

VIDEO CLIP 3 (8 sec) — from IMAGE 3

PHASE 1 (first 2 sec) — START:

Thick resin stream begins pouring from a tilted mixing bucket into the center of the mold. The stream is slow, continuous, unbroken. Resin makes first contact with the materials and begins to spread outward from the impact point.

PHASE 2 (next 3 sec) — FILL:

Resin spreads steadily in all directions across the mold interior, rising slowly and evenly around and over the embedded materials. The mold walls contain the liquid completely — no spillage, no overflow at any moment. The resin level rises visibly each second.

PHASE 3 (final 3 sec) — COMPLETE:

The pour stops. Gloved hands lower the empty bucket and set it beside the mold. The resin surface settles into a perfectly flat, glassy plane sitting 3–5 mm below the top of the mold walls. The mold is completely and evenly filled. Zero resin outside the mold. Camera holds steady overhead diagonal. Heavy pour sound fades to silence. 9:16 vertical.

VIDEO CLIP 4 (6 sec) — from IMAGE 4

Heat gun makes slow steady sweeping passes 15–20 cm above the wet resin. Micro-bubbles pop across the surface as warm air passes. Liquid surface stays perfectly flat after each pass. Macro shot. Heat gun airflow sound. 9:16 vertical.

VIDEO CLIP 5 (6 sec) — from IMAGE 5

Polishing machine moves in slow overlapping circular orbits across the cured [resin colour] surface. A thin semi-transparent milky compound film covers the active working zone — flat, no thicker than 1 mm, with [embedded materials] faintly visible through it. As the pad completes each orbit, the film thins and disappears, revealing a hyper-reflective mirror surface with [embedded materials] in sharp optical clarity beneath. Clarity builds continuously with each pass — no sudden transitions. Flat compound smears visible only at the active pad edge. Machine hum and microfiber friction sound. Overhead diagonal. 9:16 vertical.

VIDEO CLIP 6 (10 sec) — from IMAGE 6

Slow elegant camera slide reveals the finished piece in the styled Scandinavian interior. Light caustics shift and move across the floor as the camera advances. Final wide pull-back shows the piece as the natural room centerpiece — its true scale confirmed by the surrounding furniture. Ambient room silence. 9:16 vertical.

SECTION C — FINAL ASSEMBLY INSTRUCTIONS

Tool: CapCut / DaVinci Resolve / VN Editor

CLIP SEQUENCE AND TIMING:

- Clip 1 — 6 sec — Empty mold, mold release spray
 - Clip 2 — 10 sec — Time-lapse: filling with materials
 - Clip 3 — 8 sec — Resin pour: start → fill → complete
 - Clip 4 — 6 sec — Bubble removal with heat gun
 - Clip 5 — 6 sec — Polishing to mirror finish
 - Clip 6 — 10 sec — Final reveal in interior
-

TOTAL: 46 sec — within YouTube Shorts limit

TRANSITIONS BETWEEN CLIPS:

All transitions: hard cut only.

No dissolves, no fades, no wipes, no zoom transitions.

Exception: Clip 5 → Clip 6 may use a 4-frame dip to black (0.13 sec) to signal the time skip to final reveal.

PACING NOTES:

Clip 2: speed up to 4–8× time-lapse playback.

Clips 1, 3, 4, 5: normal playback speed.
Clip 6: slight slow motion (0.85×) for cinematic feel.

AUDIO DESIGN:

Layer 1 — ambient workshop room tone (low, continuous)

Layer 2 — per-clip ASMR foreground sounds:

Clip 1: faint spray hiss, glove stretch

Clip 2: tweezers tapping, materials settling (pitch up)

Clip 3: thick liquid pour, slow spread, silence at end

Clip 4: heat gun airflow, micro-bubble pop texture

Clip 5: orbital pad hum, compound smear friction

Clip 6: silence — only faint room ambience

No music track. No narration. No sound effects library.

COLOUR GRADE:

Overall: slightly warm, natural daylight feel.

Lift shadows gently — no crushed blacks.

Boost clarity on resin surface shots (Clips 3, 4, 5).

Final reveal (Clip 6): increase warmth +10, vibrance +15.

Do NOT apply heavy LUTs — keep the look documentary, real.

SECTION D — THUMBNAIL PROMPT

Tools: Nano Banano, Grok Aurora, Midjourney v6

Split-frame vertical 9:16 thumbnail. Left half: raw [materials from selected idea] in an unprocessed state — rough, dark, heavy textures. Right half: the finished [object from selected idea] with a flawless mirror surface showing deep light refractions and caustics. A bold diagonal edge divides the two halves — no text, no overlay, no graphic elements. The contrast between raw and finished is the entire story. Studio lighting. Photorealistic. Overhead 45° diagonal camera angle. Deep depth of field.

SECTION E — YOUTUBE SHORTS METADATA

Output language: RUSSIAN

TITLE (до 60 символов):

Compelling, curiosity-driven. No clickbait. No emoji in title.

DESCRIPTION (3–4 sentences):

First sentence: what the video shows.
Second sentence: materials used and process.
Third sentence: channel topic hook.
Fourth sentence: call to action.

HASHTAGS (15 штук):

Mix of: broad reach tags + niche craft tags + Russian tags.
Format: #tag #tag #tag (all lowercase, no spaces in tag)
Required: #epoxyresin #diy #satisfying #asmr
#эпоксиднаясмола #своимируками

FIRST COMMENT (для алгоритма):

Repeat the 5 most important hashtags as a plain comment
posted immediately after upload.

CHAPTERS (временные метки):

0:00 — [название первой сцены]
0:06 — [название второй сцены]
0:16 — [название третьей сцены]
0:24 — [название четвертой сцены]
0:30 — [название пятой сцены]
0:36 — [название финала]

SECTION F — PINTEREST DESCRIPTION

Output language: RUSSIAN

PIN TITLE (до 100 символов):

Descriptive, keyword-rich. Include finished object name
and main material.

PIN DESCRIPTION (150–300 символов):

Natural language. Include: what was made, main materials,
process highlight, emotional payoff of the final reveal.
End with one question to the reader to drive saves and clicks.

KEYWORDS (10 штук через запятую):

Russian + English mix. Include object type, materials,
process, and style words.

SECTION G — REPLICATION CHECKLIST

Read before starting generation. Check every item.

PRE-GENERATION:

- ☐ Mold track selected: Track A (silicone/polyurethane) or Track B (precision frame) based on object size
- ☐ Exact dimensions from scale table added to IMAGE 1 prompt
- ☐ Correct support structure selected: single workbench (small/medium) or double workbench/sawhorses (large)
- ☐ Selected idea pasted into STEP 2 placeholder
- ☐ Materials, colours, and object type identified

IMAGE GENERATION (Section A):

- ☐ IMAGE 1 generated standalone — master scene established
- ☐ IMAGE 1: object dimensions and support structure correct — dining/river table rests on two workbenches, floor visible
- ☐ IMAGE 2 generated with IMAGE 1 as reference
- ☐ IMAGE 3 generated with IMAGE 2 as reference
- ☐ IMAGE 3 shows ONLY first moment of pour — small pool at contact point only, rest of mold still dry
- ☐ IMAGE 4 generated with IMAGE 3 as reference
- ☐ IMAGE 4: mold shown completely filled with flat resin surface
- ☐ IMAGE 5 generated with IMAGE 4 as reference
- ☐ IMAGE 5: compound is a thin flat semi-transparent film — no domes, no raised masses, underlying materials visible through the film
- ☐ IMAGE 6 generated with IMAGE 5 as reference
- ☐ All 6 images: same studio, same mold position, same camera angle, same lighting direction
- ☐ Scale consistent across all 6 images
- ☐ Mold always larger than materials inside it
- ☐ Nitrile gloves in images 1–4, removed in images 5–6

VIDEO GENERATION (Section B):

- ☐ Each clip generated from its corresponding image
- ☐ VIDEO CLIP 3 covers all three phases: pour start → fill → complete (mold fully filled, no spillage)
- ☐ VIDEO CLIP 5: compound film is thin and flat — no grey dome or opaque cloud at any moment of the clip
- ☐ Grok Imagine Video: minimum 6 sec per clip confirmed
- ☐ Audio instruction included in every Grok prompt
- ☐ No morphing, no impossible transitions

ASSEMBLY (Section C):

- ☐ Clips in correct sequence (1→2→3→4→5→6)
- ☐ Hard cuts between all clips except Clip 5→6
- ☐ Clip 2 speed: 4–8× time-lapse applied
- ☐ Clip 6 speed: 0.85× slow motion applied

- ☐ Total duration: 44–48 seconds confirmed
- ☐ Audio layers mixed: room tone + foreground ASMR
- ☐ Colour grade applied: warm, natural, no heavy LUT

PUBLISH:

- ☐ Thumbnail generated (Section D)
- ☐ Title, description, hashtags ready (Section E)
- ☐ First comment prepared for immediate post-upload
- ☐ Chapters/timestamps formatted and added
- ☐ Pinterest pin prepared (Section F)

END OF MASTER PROMPT
